

PROBLEM No. 1

a. 1p

From the symmetry of the situation we take the magnetomotive force along a circular path of radius r , centered on the wire.

$$\oint \vec{B} d\vec{l} = 2\pi r B = \mu_0 I \Rightarrow B = \frac{\mu_0 I}{2\pi r}$$

b. 1.5p

Consider two elements dx of the rod placed symmetrically at distances x from its center. The corresponding forces acting on them are:

$$dF' = \frac{\mu_0 I' dx}{2\pi(d - x \sin \alpha)}$$

$$dF'' = \frac{\mu_0 I' dx}{2\pi(d + x \sin \alpha)}$$

The sum of their torques is:

$$dM = (dF'' - dF')x = -\frac{2\mu_0 I' x^2 \sin \alpha dx}{2\pi(d^2 - x^2 \sin^2 \alpha)}$$

For very small angles, the total torque is:

$$M = \int_0^{L/2} -\frac{\mu_0 I' \alpha x^2 dx}{\pi d^2} = -\frac{\mu_0 I' \alpha L^3}{24\pi d^2} = \frac{mL^2}{12} \ddot{\alpha} \Rightarrow T_{\text{slant}} = 2\pi d \sqrt{\frac{2\pi m}{\mu_0 I' L}}$$

c. 1p

Taking path integrals along circular field lines exactly like at the first point, we get:

$$B_{\text{IN}} = 0$$

$$B_{\text{OUT}} = \frac{\mu_0 I}{2\pi r}$$

d. 0.5p

The above argument keeps holding, and the results are:

$$B_{\text{WIRE SIDE}} = \frac{\mu_0 I}{2\pi r}$$

$$B_{\text{OTHER SIDE}} = 0$$

e. 1p

$$J(r) = \frac{I}{2\pi r}$$

$$\Delta B_{\parallel} = B_{\parallel \text{OTHER SIDE}} - B_{\parallel \text{WIRE SIDE}} = 0 - \left(-\frac{\mu_0 I}{2\pi r}\right) = \mu_0 J$$

f. 1.5p

Consider a small region of the plane having dimensions da along J and db across J .

$$J = \frac{B_2 - B_1}{\mu_0}$$

Let B_0 be the external magnetic field and B' the field generated by the conducting plane.

$$\left. \begin{array}{l} B_1 = B_0 - B' \\ B_2 = B_0 + B' \end{array} \right\} \Rightarrow B_0 = \frac{B_1 + B_2}{2}$$

$$dF = dI \cdot da \cdot B_0 = J \cdot db \cdot da \frac{B_1 + B_2}{2} = \frac{B_2 - B_1}{\mu_0} dS \frac{B_1 + B_2}{2} \Rightarrow p = \frac{dF}{dS} = \frac{B_2^2 - B_1^2}{2\mu_0}$$

g. 0.5p

Just as before,

$$B_{\text{IN}} = 0$$

$$B_{\text{OUT}} = \frac{\mu_0 I}{2\pi r}$$

h. 1p

This time the path integrals go the other way around.

$$B_{\text{IN}} = \frac{\mu_0 I}{2\pi r}$$

$$B_{\text{OUT}} = 0$$

i. 1p

Consider two elements dl of the wire, placed symmetrically at a distance l from the center of the wire. Their contributions to the magnetic field in the mediator plane are equal:

$$|d\vec{B}| = \frac{\mu_0 I dl \sin(90^\circ - \beta)}{4\pi r^2} = \frac{\mu_0 I dl}{4\pi d^2} \cos^3 \beta$$

$$l = d \tan \beta \Rightarrow dl = \frac{d}{\cos^2 \beta} d\beta \Rightarrow |d\vec{B}| = \frac{\mu_0 I}{4\pi d} \cos \beta d\beta$$

$$B = 2 \int_0^\alpha \frac{\mu_0 I}{4\pi d} \cos \beta d\beta = \frac{\mu_0 I}{2\pi d} \sin \beta \Big|_0^\alpha = \frac{\mu_0 I}{\pi L} \frac{\sin^2 \alpha}{\cos \alpha}$$

j. 1p

From a point in the equatorial plane, the axis of the poles of the sphere is seen under an angle 2α , with $\tan \alpha = R/r$.

Outside, the sphere behaves similarly to an electric current flowing directly from one pole to the other through a wire connecting the poles directly:

$$B_{\text{OUT}}(r) = \frac{\mu_0 I R}{2\pi r} \frac{1}{\sqrt{r^2 + R^2}}$$

Inside, the sphere behaves similarly to two semi-infinite straight conductors connecting the two poles of the sphere and carrying the current I in the opposite direction:

$$B_{\text{IN}}(r) = \frac{\mu_0 I}{2\pi r} \left(1 - \frac{R}{\sqrt{r^2 + R^2}} \right)$$
